CLOUD COMPUTING ARCHITECTURE

The National Institute of Standards and Technology (NIST) provides a concise and specific definition: Cloud computing is a model for enabling convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.

How it works

- Utilizes the network as a means to connect user end point to resources that are centralized in a data center.
- The data center may be accessed via the internet or a company network, or both.
- Allows access from a variety of end points such as a mobile phone, a PC or a tablet.
- Cloud services may be designed to be vendor agnostic, working equally well with Linux, Mac and PC platforms.

Involves multiple components communicating with each other over application programming interfaces, usually web services and 3-tier architecture.
