What is Cloud Computing– Part 1

Cloud computing is a new way of thinking when delivering IT enabled business services like application development and test.

Cloud is:

- A new consumption and delivery model inspired by consumer Internet services
- End-user focused

Cloud enables:

- Self-service
- Sourcing options
- Economies of scale

Cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources that can be rapidly provisioned and released with minimal management effort.

Cloud Computing Network

Infrastructure, Platform and Cloud Computing

Every cloud is some combination of a service and deployment model. Regardless of the type of cloud, one fact remains true:

**NO network means
NO cloud**

- Users cannot access their cloud services.
- Applications, data, and users cannot move between clouds.
- The infrastructure components that must work together to create a cloud cannot.

Cloud Computing Security Risks

Security is among a top concern with cloud computing...

Attributes of Cloud Networking

- **Scalability:** The cloud network must scale to the overall level of throughput required to ensure that it does not become a bottleneck.
- **Low Latency:** The cloud network must deliver microsecond latency across the entire network fabric because low latency improves application performance and server utilization.
- **Guaranteed Performance:** The cloud network must provide predictable performance to service many simultaneous applications in the network, including video, voice, and web traffic.
- **Extensible Management:** Real-time upgrades and image/patch management in a large cloud-network is a daunting challenge to network administrators.
- **Self-Healing Resilience:** Cloud networks operate 24x7, so downtime is not an option. This requires a network architecture that offers self-healing and the ability for transparent in-service software updates.
